**ABSTRACT**

The present disclosure describes a clamp used for adherence and securement to a desired object. The clamp has an upper half and a lower half held together by hinges. Opposite the hinges there is a locking mechanism which can be loosened or tightened as necessary. The clamp further has a shaped support designed to support a number of objects including solar lights, flags, poles, signs, rods, and the like. The clamp is designed to fit on existing colonial style and chain link fence structures, however, the clamp can be sized appropriately for the specific need.
